TITLE: Course of Physics in Schools of the Mongolian People's Republic (Kurs fiziki v shkolakh Mongol'skoy Narodnoy Respubliki)

PERIODICAL: Fizika v Shkole, 1958, Nr 3, pp 42-46 (USSR)

ABSTRACT: In prerevolutionary time, Mongolia had only one primary school with 40-50 students in attendance and the percentage of literacy did not exceed 0.5% of the population. At present, the republic spends large sums for schooling, laboratory equipment and visual aids, to turn out cadres of theoretically and practically trained graduates. In this connection, the physics course in school is extremely important. By now, all physics and chemistry studies are equipped with high quality instruments imported from the Soviet Union. Soviet teachers, invited as instructors, are assisted by Mongolian teachers, who do the interpreting. Since 1950, textbooks on physics by the following Soviet authors have been translated: A.V. Peryshkin; G.I. Faleyev and V.V. Krauklis (published in 1948); Professors I.I. Sokolov, P.A. Znamenskiy, S.S. Moshkov and others. Since 1947, the Mongolian school programs in physics are almost

Card 1/2

47-58-3-9/27

Course of Physics in Schools of the Mongolian People's Republic

equal to those of the general Soviet secondary schools. In 1942, a Mongolian State University was founded in Ulan-Bator, including a joint faculty of mathematics and physics. In 1953, the 3-year Pedagogical Institute was founded to prepare future teachers, but in 1957 it was converted into the 4-year State Institute of Pedagogy. There is 1 Mongolian reference, and 1 table.

TITLE: An anticorrosive coating with prospects

SOURCE: Tekhnika i vooruzheniye, no. 6, 1966, 55-57

TOPIC TAGS: corrosion protection, protective coating, nickel plating, corrosion resistance

ABSTRACT: The use of nickel-phosphorus²⁶ coating applied to metal surfaces by means of a chemical-nickel plating is discussed. This chemical bath method is considered simpler and less expensive than the galvanic plating. The bath is filled with a solution of nickel salt and hypophosphite with organic additives. The solution contents are shown in a table. The chemical process in a bath heated to 80 - 98 C is described. The progressive decline in the yield rate and its restoration by adding fresh chemical agents is explained and graphically illustrated. A chemical plating circulation system is shown in a flow diagram including the bath, preheater, cooler, regenerator and filter. After the chemical process, the coated surfaces are submitted to a 30-min heat treatment at about 450 C for steel and at about 230 C for aluminum. The corrosion resistance is approximately the same as for chrome plating. However, the nickel-phosphorus coatings can preserve their resistant properties at higher temperatures (up to 800 C). Their resistance

2

to wear and ⁶friction is also higher at high temperatures. They can also be applied to non-metal surfaces such as plastics, ceramics, etc. The formation of nickel alloys¹⁶ is considered and their use for decreasing the cyclic fatigue stresses in coated steel is also examined. PLANS I BOOK REPAIRING

807/1981

Specialized technical handbook for repair and maintenance of machine-building plants in two volumes. Vol. 2: Technology of Repair Operations. Moscow, Mashin, 1979. vii, 1929 p. 30,000 copies printed.

Comp. M.: Ye.V. Antoshin, Engineer; M.: K.G. Tsepka, Engineer; Tech. Ed.: T.Y. Sokolova, Ed. of Ser.; Ye.V. Antoshin, Engineer; A.P. Vladimirov, Editor of Technical Sciences; and M.A. Sokolov, Candidate of Technical Sciences; Managing Ed. for Literature (Mashin): V.I. Krylov, Engineer.

PURPOSE: This handbook is intended for personnel responsible for repair and maintenance operations in a machine-manufacturing plant.

CONTENTS: The handbook contains information pertinent to the organization of repair and maintenance operations, design-preparation of maintenance work, and economics of maintenance. Information on scientific research organizations and plants participating in preparation of this volume is included in the coverage of Volume 1 (807/1979). There are no references. Basic topics covered include: second-handing and making of parts in maintenance operations; metal-working, welding, and pipe-fitting finishing operations involved in maintenance work; making of parts for precision; basic bench and assembly work; maintenance of power and heat engines; and maintenance of foundations.

TITLE: Porous Chrome Plating of Piston Rings in the Overhauling of Motors
(Poristoye khromirovaniye porshuevykh kolets pri remonte dvigateley)

PERIODICAL: V sb.: Remont avtomobiley. Nr 1, Moscow, Avtotransizdat, 1956, pp 266-282

ABSTRACT: To chrome-plate piston compression rings it is practical to use porous Cr of tuberculated type, which is produced by anodic etching of a specified intensity of dull-bright Cr deposits. The capacity of the tuberculated Cr for being worn in depends upon the geometry and the physical and mechanical properties of its surface. An increased intensity of the anodic etching as compared to the optimum intensity (480 amp min/dm^2) causes a considerable decrease in the hardness, an increase in the wear of the contact surfaces, formation of a soft layer and a great increase in porosity. The phenomenon of the rapid wearing in of the tuberculated Cr is related to the plastic deformation

Card 1/2

SOV/137-57-11-22045

Porous Chrome Plating of Piston Rings (cont.)

of the coating and the formation of a very fine abrasive. The fitting of one top piston ring of tuberculated Cr into each cylinder of the type V-2 engine decreases the wear of the whole set of rings by 41 percent, considerably decreases the gas pressure in the crankcase, and prolongs the service life of the pistons of a completely overhauled motor - three times.

AUTHOR: Zhikh, V.A., Candidate of Technical Sciences

TITLE: Electrolytic Polishing of Machine Components (Elektroliticheskoye polirovaniye detaley mashin)

PERIODICAL: Vestnik Mashinostroyeniya, 1958, Nr 6, pp 58-60 (USSR)

ABSTRACT: The electrolytic polishing of several stainless steels and one aluminium alloy are described on the basis of published information and some original test work. A universal electrolyte consisting of 55% phosphoric acid, 15% sulphuric acid, 6% chromium anhydride and 14% water is recommended. Typical conditions for stainless steel include a voltage of 6 V, a current density of 60 A/cm² and a duration of 8 minutes. Some steels require 18 V. Aluminium alloy is polished at 10 V. The etching of corrosion initiation spots takes place and crack detection is often unnecessary. The lead cathode is preferably given a suitable shape to equalise the electric field. Porous diaphragms materially reduce the accumulation of tri-valent chromium which poisons the electrolyte. The diaphragms are made of kilned fireclay.

TITLE: Accelerating the rate of electrolytic galvanizing by ultrasonics

SOURCE: Vestnik mashinostroyeniya, no. 9, 1966, 45-47

TOPIC TAGS: ultrasonic emitter, zinc plating, electrolyte

ABSTRACT: For the tests a special apparatus was constructed, consisting of a Type UZG-10M ultrasonic generator and a special galvanic bath with a Type PMS-6 magnetostrictive transformer in its bottom part; the bath was equipped with electrical measuring instruments, rheostats, and an exhaust fan. The experiments used the most widely employed industrial electrolyte, consisting of 200 grams/liter zinc sulfate, 45 grams/liter sodium sulfate, 30 grams/liter aluminum sulfate, and 10 grams/liter dextrin, with a pH of 3.9-4.1. The experimental results are exhibited in a series of curves. The effect of ultrasonics on a sulfuric acid galvanizing electrolyte makes it possible to increase considerably the cathode current density, which results in increasing the rate of growth of the electrolytic zinc by a factor of 12-15 times. The optimum current density was 11-15 a/dm². The deposits in the presence of ultrasonics were more uniform and had a greater density and hardness. The application

Card 1/2

 AUTHOR: Zhikhar', N.A. (Khar'kov) 05776
 SOV/41-11-4-2/15
 TITLE: On the Theory of the Extensions of J-Symmetrical Operators
 PERIODICAL: Ukrainskiy matematicheskiy zhurnal, 1959, Vol 11, Nr 4, pp 352-365 (USSR)
 ABSTRACT: The author considers J-selfadjoint and J-symmetrical operators (compare [Ref 4]). Let A be a J-symmetrical operator and λ_0 be a point of regular type. The J-selfadjoint extensions of a J-symmetrical operator A for which λ_0 is of regular type, are denoted as correct extensions. Let G be the orthogonal complement of $\Delta_{\lambda_0}(A) = (A - \lambda_0 I)D_A$ in the Hilbert space H. The dimension m of G is called the defect number of A in the point λ_0 .
 Theorem 1: Let A be a J-symmetrical operator. If for a λ the range of values $\Delta_{\lambda}(A)$ of $A - \lambda I$ is identical with H, then A is J-selfadjoint.
 Theorem 2: Every J-symmetrical operator A for which λ_0 is of regular type, can be extended to a J-selfadjoint operator A' so that λ_0 for A' is of regular type.
 Card 1/2 Theorem 3: If A' is a correct J-selfadjoint extension of the

05776

SOV/41-11-4-2/15

On the Theory of the Extensions of J-Symmetrical Operators

J-symmetrical operator A , then

$$(14) \quad D_{JA^*J} = D_A + (A' - \lambda_0 I)^{-1} \mathcal{N}_{\bar{\lambda}_0} + J \mathcal{N}_{\bar{\lambda}_0},$$

where $\mathcal{N}_{\bar{\lambda}_0}$ is the subspace of the solutions of

$$(4) \quad A^*u - \bar{\lambda}_0 u = 0 \quad (H = \Delta_{\lambda_0}(A) + \mathcal{N}_{\bar{\lambda}_0}).$$

Theorem 4: If

$$(20) \quad A^*u - \bar{\lambda}_0 u = 0$$

in the point λ_0 (of regular type) of the J-symmetrical operator A has exactly $m(\lambda)$ solutions, then it has just as many solutions in every other regular point of A .

Theorem 5 gives necessary and sufficient conditions that \tilde{A} is a correct J-selfadjoint extension of the J-symmetrical operator A . Further four theorems relate to the application of the theory to a one-dimensional boundary value problem on the semiaxis.

The author mentions I.M.Glazman, and M.I.Vishik.

There are 6 references, 5 of which are Soviet, and 1 German.

TITLE: Ice-forming properties of lead²¹ iodide²¹ aerosols produced by combustion of metallo-iodide compounds

SOURCE: AN SSSR. Izv. Ser. geofizicheskaya, no. 8, 1963, 1278-1284

TOPIC TAGS: aerosol, ammonium iodide, lead iodide, fog, supercooled fog, aqueous fog, cloud chamber, ice crystal

ABSTRACT: The crystallizing effect of PbI_2 aerosol on a supercooled aqueous fog in a cloud chamber has been investigated. The aerosols were produced by the combustion of lead powder and iodine-containing substances (crystalline I, NH_4I , CHI_3 , and $O=C_6I_4=O$). The quantity of ice crystals produced at a fog temperature of $-10^\circ C$ is dependent on the material used and ranges from 2.3×10^{-1} to 5×10^{12} crystals per gram. An aerosol produced from an NH_4I aerosol is as effective as a pure PbI_2 aerosol obtained by the sublimation of lead iodide in an electric arc. The ice-forming capability of PbI_2 aerosols produced by the combustion of metallo-iodide

Card 1/2

L 17693-63

ACCESSION NR: AP3005590

materials increases with a temperature decrease of the aqueous fog. Aerosols of all the investigated metallo-iodide materials are highly monodispersive: between 53 and 71% of the particles are $0.05-0.15 \mu$ in diameter. The predominant fraction of particles in an aerosol is dependent on the iodide-containing substance used. Orig. art. has: 2 figures, 2 tables, and 1 formula.

TITLE: Melting-pouring unit. Class 31, No. 186647

SOURCE: Izobreteniya, promyshlennyye obraztsey, tovarnyye znaki, no. 19, 1966, 73

TOPIC TAGS: active metal, metal casting, metal vacuum melting, centrifugal casting, casting unit, vacuum casting unit

ABSTRACT: This Author Certificate introduces a melting-casting unit for centrifugal casting of reactive metals. The unit consists of a vacuum chamber which contains a centrifuge with a vertical axis of rotation. The melting crucible is mounted in the center of the centrifuge; the molds are on the periphery. To ensure continuous pouring of metal without extinguishing the arc and tilting the crucible, the latter is provided with side openings connected with an annular collector installed between the molds and the crucible.

Zhukharev, S. A. METHODS OF IMPROVING THE PHYSICO-CHEMICAL CHARACTERISTICS OF BLAST-FURNACE BRICK. *Ogneupory*, 11 [1] 26-38 (1940).—Physicochemical characteristics of representative blast-furnace brick made in the U. S. and in the Soviet Union are compared. Russian brick are inferior to the American product because of inferior materials and backwardness in manufacturing processes. To improve the processes, the following studies were made on a laboratory scale: (1) effect of grog dust on mechanical properties and compactness; (2) effect of pressure on compactness of brick; (3) selection of optimum ratio between clay and grog; and (4) preliminary treatment of charge. The following suggestions are made: (1) Clay and part of the grog should be ground together. (2) Tube mills for grinding the components of the charge together should be installed; (3) More powerful presses should be used; (4) The grog fraction 0.5 to 3 mm. should be stored separately and dampened before the ground mixture of clay and part of the grog is added.

Title : Use of cutters with mineral-ceramic tips
Periodical : Stan. 1 instr., ²⁷ 2, 19-21, F 1956
Abstract : According to the author, cutters provided with mineral-ceramic tips permit much faster operation in finishing and semi-finishing processing of cast iron, brass, copper, plastics, etc. He gives concise analysis, the results of work done with a mineral-ceramic cutter, makes practical suggestions, and graphically illustrates his findings. Four diagrams.

TEXT: A method was developed for analyzing alloys, containing large quantities of Cu, Al, Ni, Co and Fe, using urotropine and complexon III (I). 0.25 g of alloy are dissolved in HNO_3 (1:4), 20 ml H_2SO_4 (1:3) are added and the mixture evaporated to white fumes. 100 ml of water, 5 ml concentrated HCl and 30 ml of 30% solution of $\text{Na}_2\text{S}_2\text{O}_3$ are added to the residue and it is boiled to coagulation of CuS precipitate, which is then filtered and washed with HCl (1:19). For determination of Cu the CuS precipitate is dissolved in 20 ml of hot HNO_3 (1 : 1), 100 ml of water are added and a solution of NH_4OH to the transition of a light blue color through congo red into red. Then HCl (1:1) is added drop-wise to a rose color appearance on congo paper, murexide is introduced and Cu is titrated with 0.05 N solution I. For separation of Fe and Al from Ni and Co 10 ml of concentrated HNO_3 are added to the filtrate after separation of the

CuS. The solution is boiled and upon cooling to 80° C, 2 g of NH_4Cl and NH_4OH solution are introduced until precipitation begins. The precipitate is dissolved by addition of dilute HCl and a 30% solution of urotropine is added until hydroxides precipitate. After this, 10 ml of urotropine are added in excess and the solution is held at 80° C for 10 - 15 minutes. The solution with precipitate is diluted to 250 ml and filtered. Fe and Al are determined in the precipitate. To do this, the precipitate is dissolved in hot HCl (1:9) and Fe is precipitated with NaOH. The solution with $\text{Fe}(\text{OH})_3$ precipitate is diluted to 500 ml and filtered. To 250 ml of the filtrate 20 ml of 0.1 N solution of I are added, it is made acidic with HCl using congo red paper, eriocrome black ET-00 is introduced, ammonium chloride buffer solution and an excess of I is titrated with 0.1 N solution of ZnSO_4 . For determination of Fe the precipitate of $\text{Fe}(\text{OH})_3$ is dissolved in HCl (1:1) and a solution of NH_4OH is added until precipitation begins, HCl (1:1) is then added to the precipitate. Several drops of 20% solution of sulfosalicylic acid are added to the solution and Fe is titrated with a 0.1 N solution of I. For determination of the sum of Ni + Co 0.1 - 0.2 g of murexide and 2 ml of concentrated NH_4OH are introduced to the aliquot portion of the filtrate (obtained after separation of Fe and Al by urotropine) and titrated with 0.1 N solution of I to the appearance of a pale pink

color. Then 2 ml of concentrated NH_4OH are added and titrated to transition of the color to rose-violet. In the other aliquot portion of the filtrate Co is determined by gravimetric and potentiometric methods. F. Larkov.

TITLE: An Experimental Investigation Into the Character of the Motion of Particles in Pneumatic Transport Pipelines

PERIODICAL: Inzhenerno-fizicheskii zhurnal, 1959, Nr 2, pp 25-31 (USSR)

ABSTRACT: In order to study the character of the motion of granular particles in pneumatic transport pipelines, an investigation was carried out on experimental installations of two types. The installation of the first type, pictured in Figure 1, was devised to study the motion of an individual particle with regard to the slope of the pipeline, velocity of the air flow, relative size of the particle, and the value of resistance coefficient. The installation of the second type (Figure 3), was devised to study the difference between the motion of an individual particle and the motion of the same particle in bulk, which takes place in the actual pneumatic pipelines. The experiments were carried out with balls of 2 to 20 mm in diameter made of the mixture of A.K.R.-powder with paraffin. The study of the motion of an individual particle, ball, confirmed the phenomenon of twisting of its trajectory, noticed for the first time by M.P. Kalinushkin /Ref 1/. The shape of the trajectory at various velocities of

the air flow is schematically shown in Figure 2. The following series of experiments were performed on the installation of the second type: 1. The measurements of the motion velocity of an individual particle, for which purpose the method of "marked" particles [Ref 2] was employed. Figure 4 shows the dependence of the velocity on the slope of the pipeline. 2. The determination of the effect of the relative dimensions of the particles on their velocity. This dependence, shown in Figure 5, proved to be inverse within the range of ball diameters, 7 to 20 mm, experimented with. 3. The determination of the air flow velocity which ensures the motion of the particle in the core of the flow. The results are shown in Figures 6, and 4. The detection of regularities in the motion of a "marked" particle in a mass of similar particles being transported in the pipeline. It was concluded that the minimum velocity which ensures the motion of an indi-

TITLE: International Conference on the Use of Powerful Sources of Radiation in Industry

PERIODICAL: Inzhenerno-fizicheskiy zhurnal, 1959, Vol. 1, No. 12, pp. 112-115 (USSR)

ABSTRACT: This conference was held in Warsaw from September 8 to 12, 1959 by the International Atomic Energy Agency. It was attended by 147 delegates from 27 countries. 60 lectures were heard, 13 of which were delivered by Soviet delegates. The Soviet Union was represented by U. A. Arifov, Academician of the AS UzSSR, Academician S. S. Medvedev (Moscow), Professor A. S. Kuzminskiy (Moscow), Professor N. A. Bakh (Moscow), Professor V. I. Sinitsin, T. V. Tsatskhladze, Candidate of Technical Sciences (AN GrSSR (AS Gruzinskaya SSR)), A. V. Bibergal' (Moscow), Candidate of Technical Sciences, Ye. A. Zhikharev (AN BSSR (AS BSSR)), Candidate of Technical Sciences, and Professor S. V. Karpov, head of the delegation. In a short address, the Polish premier Cyrankiewicz acknowledged the valuable aid which Poland received from the Soviet Union in the peaceful utilization of atomic energy. Of special interest were lectures delivered by Ye. V. Barelko, M. N. Kartashev, P. N. Komarov, and M. A. Proskurnin.

(USSR) on the radiative initiation of branching chain reactions. In the following the author discusses lectures held by delegates from Japan, the USA, Canada, Denmark, and Britain. An indium-gallium radiation circuit of a nuclear reactor was put up for discussion by the Soviet delegation. A. V. Bibergal's lecture on methods of calculating radiation systems for engineering purposes was also of great interest.

TITLE: Concerning the use of powerful sources of ionizing radiation in industry

SOURCE: AN BSSR. Vestsi, Seryya fizika-tekhnichnykh navuk, no. 3, 1965, 40-41

TOPIC TAGS: ionizing radiation, glass, metal, radiation chemistry, isotope, synthetic fiber, radiation polymerization

ABSTRACT: The author discusses briefly the possible use of powerful radiation sources to modify existing materials so as to impart them new prescribed properties, or to produce new types of materials. He summarizes the work done by the laboratory for the use of isotopes and nuclear radiation in this field during 1964 and indicates three
